Customer Journey Map

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage.

Phase of Journey	Stage 1: Data Input & Selection	Stage 2: Model Prediction	Stage 3: Policy Simulation & Reporting
Actions <i>What does the customer do?</i>	- Searches and selects a baseline country from the glassmorphism dropdown. - Reviews pre-filled historical indicators (Life Expectancy, Schooling, GNI). - Adjusts indicators using form fields to simulate target socio-economic policies.	- Submits the form and triggers the Linear Regression model. - Reviews the predicted HDI score and the corresponding developmental tier (e.g. Medium). - Compares the predicted result with the country's baseline.	- Incorporate predicted scores and tier data into policy briefs or reports. - Compares different development track simulations. - Saves metrics for research or academic presentation.
Touchpoint <i>What part of the service do they interact with?</i>	- Searchable country dropdown - Indicator input form & sliders - Kaggle/UNDP historical dataset reference	- Flask backend prediction API (/predict) - Pre-trained ML model (model.pkl) - Visual prediction results & tier display card	- Research output document - Presentation slide deck - Model review / feedback option

Customer Thought <i>What is the customer thinking?</i>	"Are these baseline metrics matching the latest global databases?" "The searchable auto-fill is saving me hours of spreadsheet searching." "Can I type precise decimal values into these fields?"	"Is the Linear Regression model prediction accurate enough for our planning?" "The transition to a higher tier is clearly visible now." "How heavily does GNI per capita affect this predicted score?"	"I hope these projections help justify our new education budget proposal." "These scores look highly consistent with regional benchmarks." "I will use this tool again for our next scenario planning session."
Customer Feeling <i>What is the customer feeling?</i>	Focused, curious, and appreciative of the preloaded database.	Reassured and analytically satisfied with the immediate outputs.	Productive, confident, and prepared to present data-driven findings.

Process Ownership <i>Who is in the lead on this?</i>	Policy Analyst / Researcher (User Interface Interaction)	Flask Backend application & pre-trained ML model	Policy Analyst / Researcher (Report generation & presentation)
Opportunities <i>How can we improve this stage?</i>	• Integrate an interactive map to select countries visually. • Add tooltips explaining the definition of each indicator. • Support bulk CSV uploads for multi-country evaluations.	• Display model weights/coefficients directly in the UI. • Render a line chart comparing the simulation to historical values. • Enable direct export of prediction summaries to PDF/JSON.	• Allow saving simulation history to browser local storage. • Provide a side-by-side comparison screen for multiple countries. • Add a feedback button to flag outlier predictions.
